Abstract of **WO 9814161 (A1)**

The present invention relates to a method for increasing the organism defensive capacities, wherein said method essentially comprises introducing a potentialised preparation into the organism. This preparation is obtained by repeatedly cultivating and shaking according to a homeopathic method a neutral carrier or autologous blood which is previously treated using an active physical factor. This method also comprises simultaneously exerting an action using the same physical factor that may consist of ionising radiation, high temperatures, cold, solar ultraviolet radiation, an electrical current, a sharp drop in the atmospheric pressure, etc.
